Answer to the Question No:- a)Yates Method Table

Factorial Effect

Treatment Combination	A	B	AB	C	AC	BC	ABC
(1)	-	-	+	-	+	+	-
a	+	-	-	-	-	+	+
b	-	+	-	-	+	-	+
ab	+	+	+	-	-	-	-
c	-	-	+	+	+	-	+
ac	+	-	-	+	+	-	-
bc	-	+	-	+	-	+	-
abc	+	+	+	+	+	+	+

Answer to the Question No:- b)Model Equation for 2^3 factorial design.

$$Y_{ijkl} = \mu + \alpha_i + \beta_j + \gamma_k + \alpha\beta_{ij} + \alpha\gamma_{ik} + \beta\gamma_{jk} + \alpha\beta\gamma_{ijk} + \epsilon_{ijkl}$$

Where, $\epsilon_{ijkl} \sim N(0, \sigma^2)$ Answer to the Question No:- c)

Cube labeling with corner points.

P.T.O

(2)

Answer to the Question NO:- (d)

We know,

$$\text{Effect of AB interaction} = \frac{1}{4n} [ab - a - b + (i) + abc - bc - ac + c]$$

Where $n = 3$, $ab = 148$, $a = 104$, $b = 119$, $(i) = 78$, $abc = 127$, $bc = 164$, $ac = 113$, $c = 127$.

Now,

$$\begin{aligned} \text{Effect of AB interaction} &= \frac{1}{4 \times 3} [148 - 104 - 119 + 78 + 127 - 164 - 113 + 127] \\ &= \boxed{-1.67} \text{ (Ans)} \end{aligned}$$

Answer to the Question NO:- (e)

We know,

$$SS_{AB} = \frac{(\text{Contrast})^2}{8n}$$

$$= \frac{[ab - a - b + (i) + abc - bc - ac + c]^2}{8 \times 3}$$

$$= \frac{(-20)^2}{24} = \boxed{16.67} \text{ (Ans)}$$

Answer to the Question NO:- (f)

We know,

$$MS_{AB} = \frac{SS_{AB}}{(I-1)(J-1)(L-1)} \quad \left[\begin{array}{l} A = I = 2 \text{ levels} \\ B = J = 2 \text{ levels} \\ C = L = 2 \text{ levels} \end{array} \right]$$

$$= \frac{SS_{AB}}{(2-1)(2-1)(2-1)} \quad \left[\begin{array}{l} K = \text{No. of replication} \\ = 3 \end{array} \right]$$

$$= \frac{16.67}{1}$$

$$= \boxed{16.67} \text{ (Ans)}$$

Answer to the Question NO:- (g)

$$\begin{aligned} \text{Degree of freedom in Error} &= IJL(K-1) \\ &= 2 \times 2 \times 2(3-1) \end{aligned}$$

$$= \boxed{16} \text{ (Ans)}$$

Answer to the Question NO:- (h)

$$F\text{-Stat} = \frac{MS_{AB}}{MSE}$$

$$\begin{aligned} \text{Now, } MSE &= \frac{SSE}{IJL(K-1)} = \frac{482.67}{16} \quad \left[\begin{array}{l} \text{Where given} \\ SSE = 482.67 \end{array} \right] \\ &= 30.17 \end{aligned}$$

$$\text{So, } F\text{-Stat} = \frac{16.67}{30.17} = \boxed{0.55}$$

Now, $t = 0.04$ with 200 D, all of reject

Critical value from R at $\alpha = 0.05$ level of significance

$$\begin{matrix} 2 \text{ level } S = I = A \\ 2 \text{ level } S = C = D \\ 2 \text{ level } S = J = B \end{matrix} \quad \boxed{\pm 4.49} \quad \left[\text{R-code } qf(0.95, 1, 16) \right]$$

Now, $F\text{-stat} < \text{Critical value}$
or $0.55 < 4.49$

So, we fail to reject Null Hypothesis H_0 ,

So Hypothesis. Null Hypothesis $H_0: \alpha\beta_{ij} = 0$ [for all ij]

(B) Alternative $H_a: \alpha\beta_{ij} \neq 0$ [for some ij]

$$(1-N) \text{ D.F.} = \text{degrees of freedom in error} = 177 \quad (K-1) = 2 \times 2 \times 2 = 8$$

So, as (per) findings, we fail to reject null Hypothesis H_0 . So, AB interaction term is not significant at $\alpha = 0.05$. (Ans)

$$\begin{aligned} \text{MSE} &= \frac{\text{SS}_{\text{Error}}}{\text{D.F. Error}} = \frac{185.27}{177} = 1.0467 \\ F\text{-stat} &= \frac{\text{MSE}_{\text{AB}}}{\text{MSE}} = \frac{22.0}{1.0467} = 21.02 \end{aligned}$$
